Title : On the Problem of Biocenosis

Orig Pub : Ecol. Polska, 1955, B2, No 11, 3-16

Abstract : Describes the formation of biocenoses, the cha-

racter of correlation between separate components and the forms of their bonds with the conditions of the medium. The points of view of Dal and Hesse on the self-regulation of biocenosis, and the theory of Klement and Shelford on the self-development of biocenoses are analyzed.

TITLE:

Absolute measurement of the activity of radioactive sources

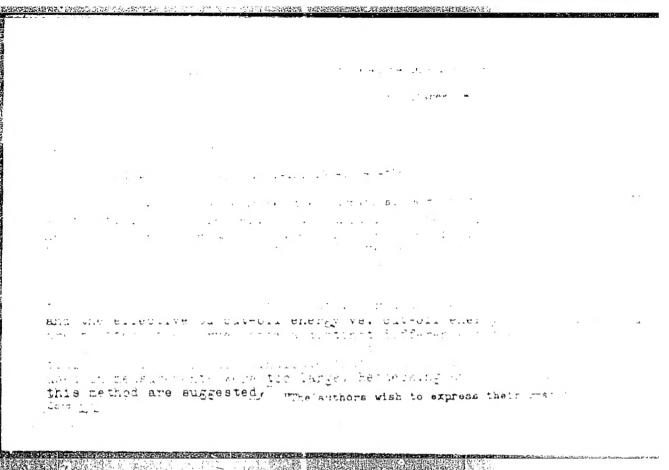

ces /

with a 4-77 counter

PERIODICAL:

Nukleonika, v. 8, no. 1, 1963, 29-39

TEXT: Absolute measurements of β and β -Y activities were conducted by means of a 4-N counter. β -particle sources with maximum energy of particles exceeding 0.5 Mev were measured correctly to 2-3% (Fig. 5). The conditions in which the probability of registration in the counter was 1 - 0.0047 for various nuclides, were established (Table 1). The characteristics of counters for various discrimination and amplification voltages were determined (Fig. 6). The absorption of β -particles in the aluminum foil, used as a target backing, was measured (Fig. 8). Losses due to finite resolving and dead times of the counter were also determined (Fig. 7). A description of active solutions used as radioactive sources is included. Their self-absorption was examined and its effects established. A photograph of the 4-N counter and a diagram of the counting circuit are also included in the article. One Polish and 6 Western references.

Organization of Hydrological Service and Hydrological Studies in the

Soviet Union

PERIODICAL:

Przegląd Geofizyczny (d.Przegląd Meteorologiczny i Hydrologiczny),

1960, No. 1, pp 77 - 82

TEXT: The author spent a few months in the Soviet Union and has the opportunity to get acquainted with the hydrological service there. In this article he gives an account of its organization. The basic investigations in the field of hydrology, meteorology and oceanography are carried out in the Soviet Union by a uniform hydrological and meteorological service directly subordinated to the council of ministers. There is the Main Office of the Hydrological and Meteorological Service and several subordinate institutions. On the lower level there are regional administrations, the stations and the observation posts (Figure 1). The author's account is restricted to 3 questions; the organization of hydrological mass observations, the organization of scientific studies and the problem of training of personnel. The hydrological network in the Soviet Union is based on the

P/027/60/000/01/08/013

Organization of Hydrological Service and Hydrological Studies in the Soviet Union

representative method. The size of the country makes it impossible to carry out observations on all rivers and lakes (their number reaches 100,000). Many articles were consecrated to the problem of the correct planning of the hydrological network, among others by Alekin, Borsuk, Shamov, Ukhanov and Urivayev. Today the network consists of 5,600 posts, in which the water measurements are carried out including 4,000 where these measurements are made daily. There are also 300 limnographs in operation. The observation posts are subordinated to hydro-meteorological stations. Each station supervises about 30 posts. The task of a station is to train and control the observers in the posts, to carry out more difficult work, to process all the material from the subordinate posts and to prepare the material for hydrological annuals. The scientific work is being carried out by various institutes subordinated to the Main Hydrological Service. The following are mentioned by the author, the GGI (State Hydrological Institute) in Leningrad, the CIP (Central Institute of Forecasts) in Moscow, the GGO (Main Geophysical Observatory) in Leningrad and the Institute for Construction of Instruments in Moscow which designs and builds prototypes of measuring instruments. The Hydrological Institute was established in 1919. It deals with the following subjects:

Card 2/3

Organization of Hydrological Service and Hydrological Studies in the Soviet Union

hydrometory, measuring instruments, low tides, lakes and marsnes, forecasting and dynamics of river beds. The program of work is laid down by the Scientific Council of the Institute and is approved by the Main Office. All themes being worked out are the subject of a public discussion at an assembly of the Scientific Council. The Council decides whether the paper should be accepted and published in the official publication of the Institute. Each of the institute mentioned has its scientific outstations. The GGI has the Valdai laboratory, the station in Dubovka, the hydraulic laboratory in Zelonogorsk etc. The hydrological Laboratory in Valdai Hills (VNIGL) extends its work over an area of 10,000 km." It is equipped with 500 measuring instruments, including 130 self-recording ones. Training on university level is centered in the Hydrological and Meteorological Institution in Leningrad. Graduates receive the degree of Engineer. There are 2 figures and 12 Soviet re-

TITLE: Hieroscopic neutron flux distributions in unit cells of critical assemblies of the MPY Project

SOURCE: Nukleonika, W. 9, No. 7-8, 1964, 575-585

TOPIC TAGS: neutron distribution, reactor physica, intracell neutron distribution, unit cell, critical reactor, NPY project

ABSTRACT: This article, which is one of the first official reports

Card 1/3
```

L 19670-65 ACCESSION NRI AP4045667

0 of the NPY Project, contains a preliminary study of intracell neutron distributions in three critical assemblies operating in Norway, Poland, and Yugoslavia. The NPY lattices that were studied and the experimental techniques used in three zero-power reactors (NORA, ANNA, and RB) are discussed and experimental and theoretical results are given in tabular form (refer to the Enclosures). The computational methods used in Norway and applied to the NPY lattices involved the use of two integral transport codes (available for use on the Perranti Hercury computer) developed by the Netherlands-Norwegian K-7 Project at Kjeller-K-7 THERMOS and K-7 TRANSPO: cross-sections used in these codes are given in tables. Two analytical methods were used in Poland: the first, used for NORA and ANNA, made use of a one-group Amouyal-Benoist approach applied to a multilayer system; the second used the Laguerre polynomial expansion for distributions in the moderator. Two computational methods were employed in Yugoslavia: a standard one-velocity P3 method with isotropic flux return at the outer boundary and an improved analytical neutron thermalization method developed in Yugoslavia. The experimental and theoretical results obtained for NORA lattices show that the experimental values

March.

"Sorpcja kwatu siarkawego press macsic zicranisctoną", Przemysi
Chemiczny, No. 1, 1934, pp. 23—29, 13 rys., 2 tub.

The influence was investigated of concontration, temperature and
acidity of salution on the sorption increases with rise in temperature, the
in water colution. The corption increases with rise in temperature, the
rate of increase depending on the concentration of sulphurous acid in
solution. The relationship between the concentration of sulphurous acid
solution and the extent of sorption can be presented especially
in solution and the extent of sorption can be presented especialmatuly
by means of a linear function. When the pH of the solution increases,
the sorption decreases, altains minimum at the pH frange of from 4 to
6, then increases till the pH value reaches 10; at any higher pH the
extent of sorption decreases slowly.

TITLE: Transistorized voltage regulators for generators of shipboard (airplane) electrical networks

SOURCE: Warsaw. Instytut lotnictva, Prace, no. 25, 1965, 40-52

TOPIC TAGS: BECKENIUMETWAKKY voltage regulator, transistor, transistorized circuit, aircraft electric power equipment, electric generator

ABSTHACT: The article analyses voltage regulators for both ac and dc generators for airplane electrical networks which, because of the requirements of modern aircraft instruments, require an electric power supply in which the voltage is regulated within narrow limits. The transistorized regulator described in particular here has a number of interesting and original design features which make possible the complete automation of the generator and which meets the voltage regulation requirements. The ac generator regulator has an additional feature which serves to synchronize the generator with the ac network. This problem, however, is not the subject of the article. The article makes it possible to acquire a rapid acquaintance with transistor technique in airplane electrical network voltage stabilisation and its

0

advantages. The accuracy of the voltage regulator described when the generator is at full load does not exceed \pm 0.25% at normal temperature and \pm 0.5% in the temperature range from 40 to 50° G. The transistorized regulator has long life and when silicon transistors are used it can operate in a considerably wider temperature range. Orig. art. has: 29 figures and 3 formulas.

TITLE:

liatrix function method for computing transient processes in linear lumped circuits with arbitrary periodic disturbances

PERIODICAL:

Archivum elektrotechniki, v. 11, no. 3, 1962,

417-429

TEXT: The method consists in applying the Lagrange-Sylvester theorem to a set of n linear differential equations with constant coefficients. Instantaneous values of coil current and capacitor voltages are taken as the unknowns: Kirchoff's laws are transformed into $\frac{d}{dt} = AX + F(t)$ where $X = (x_1, ..., x_n)$, $F = (f_1, ..., f_n)$.

The elements a_{kl} of the matrix A are real and depend on R, L, C, M. The elements $f_a(t)$ depend on disturbances, sometimes on time derivatives of these on L, C, M. From the solution

 $X = e^{A(t-t_0)}X_{+} + \begin{pmatrix} t & e^{A(t-\tau)} & F(\tau) & d\tau \end{pmatrix}$ (2)

POPULATION REPORT TO THE PROPERTY OF THE PROPE

TITLE: The correlation method of analysis of circuits with random parameters at stochastic forcings

SOURCE: Archiwum elektrotechniki, v. 15, no. 1, 1966, 113-127

TOPIC TAGS: correlation analysis, random parameter, stochastic process

ABSTRACT: The paper presents the correlation method of analysis of stochastic processes with a normal or almost normal distribution in circuits with parameters R, L, C, and M, which are random variables at stochastic forcings and casual initial conditions. Formulas are derived for the determination of expected values, correlation functions, and reciprocal correlation functions for currents in coils and capacitor voltages under transcient and stationary conditions. The procedure proposed is illustrated by an example of a circuit with two independent contact points. Orig. art. has: 77 formulas. [Based on author's abstract]

Abstract: By method described before (RZh Khim., 1954, 25327) with the aid of a Swietoslawski's differential ebulliometer (Swietos-

lawski W. Ebulliometric Measurements, No 4, 1945) were measured boiling and dew points of trinary systems: n-octane-2.6 lutidine-acetic acid (I); n-decame - 2.6 lutidine-acetic acid (II) at 760 mm of merc. column pressure. Isobars of (I) and (II) systems show spinal lines sharply displaced toward lutidine-hydrocarbon side. With analogous trinary azeotropic systems studied before, where the place of lutidine was occupied by pyridine, such a phenomenon was not observed. The difference between isobars of the two systems is ascribed by the authors to the circumstance that the azeotropic lutidine range

in regard to saturated hydrocarbons is much less than that of
